K Laroche A., Frick M.M., Kazala C., Weselake R.J., Thoma I Isolation and characterization of an oilseed rape fruc I bisphosphatase cDNA.";

L Plant Physiol. 108:1335-1336(1995).

C -! CATALYTIC ACTIVITY: D-Tructose 1.6-bisphosphate + H fructose 6-phosphate + phosphate.

C -! SUBCELLANEOUS: IN PLANTS THERE ARE TWO FBPASE ISOZY CYTOSOL AND THE OTHER IN THE CHLOROPLAST.

C -!- SIMILARITY: BELONGS TO THE FBPASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic forms that the compounts of the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are
                                                                                                                                                                                                                                                                 WO200170955-A2
                                                                                                                                                                                                                                                                                                       Salmonella typhi

cc genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are cc Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The cc invention is also useful for the identification of potential new targets compended to identify proteins used in proliferation, to express these proteins. The antisense nucleic acids can also be used to identify proteins used in proliferation, to expressed proteins. The proteins can be used to screen compounds in rational drug discovery components. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery components. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery components used to screen compounds in rational drug discovery components of the proteins can be used to screen compounds in rational drug discovery components used in calcia sequence is also useful to screen compounds in rational drug discovery components used in properties and the properties and the properties are required for cell proliferation in can wide variety of organisms. The present sequence represents an component component component component component in the properties of the printed specification, but was obtained in electronic format directly from wipo at cell proliferation in electronic format directly from wipo at cell proliferation in electronic format directly from wipo at the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Haselbeck R,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The protein, homologs and analogs of the invention can be used as a novel approach to developing drugs useful for the treatment of jelly fish stings, pharmaceuticals with blood platelet agglutination activity, pesticides by use of the hemolytic activity, and in the study of the hemolytic mechanism. AAY33648-T33650 represent fragments of the hemolytic protein described in the invention
                                      This invention describes a novel protein which has hemolytic activity, blood platelet agglutination activity and a molecular weight of about 50,000 Da (by SDS-PAGE). The protein, homologs and analogs of the invention can be used as a novel approach to developing drugs useful for the treatment of jelly fish stings, pharmaceuticals with blood platelet agglutination activity, pesticides by use of the hemolytic activity, and in the study of the hemolytic mechanism.                                                                                                                                                                                                         polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                               and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printer specification, but was obtained in electronic format directly from W at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, u diagnostics, forensics, gene mapping, identification of responsible for genetic disorders or other traits and t biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N-PSDB;

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC cand gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags (CC for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human CC Note: The sequence data for this patent did not appear in the printed at fire wiso int/nub/nub/shed not sequences.

and in recombinant production of (II). The polypucleotides are also used in diagnostics as expressed sequence tags (I): (II) is useful in gene therapy techniques (I): (II): (II) is useful for generating antibodies against it, detecting or (II): (II) is useful for generating antibodies against it, detecting or (II): (II) is useful for generating antibodies against it, detecting or (II): (II): and its binding partners are useful in medical activity. (II): and (III): and (III): are useful in medical (II): (II): are useful for treating (II): (II): are useful in medical (II): (II): are useful for treating (II): are useful for treating (II): are useful for treating (II): are useful for treati
Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromo and gene mapping, and in recombinant production of (II). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 20; SEQ ID No 34186; 103pp; English.
